Arguments to wrapper: %d %n %o %l %v

☐ Wrapper can run any SBML Level / Version

You can use the following substitution codes in the wrapper command line arguments:

%d = path to the directory containing all test cases
 %n = current test case number (of the form NNNNN)
 %o = directory where the CSV output file should be written
 %l = the SBML Level to be used
 %v = the SBML Version to be used

Each test case consists of an SBML file and a settings file. The files will be located in the directory %d/%n. The SBML file will be named '%n-sbml-%l%v.xml', where %l is replaced by the SBML Level and %v is replaced by the Version within the Level. (Example: '00123-sbml-l2v3.xml'.) The test settings file will be named '%n-settings.txt' in the same directory. (Example: '00123-settings.txt'.) The application must be instructed to write out the results into a file named '%o/%n.csv' so that this test runner can find it.
